

BOLIVIAN SQUIRREL MONKEY

Description

The Bolivian Squirrel Monkey has a small, white face with a black nose and muzzle. Its coat varies in colour from brown and grey to golden. It also has a slim tail that is much longer than its body.

Diet

Bolivian Squirrel Monkeys are **omnivores** and eat insects, fruit and seeds.

In the wild

Bolivian Squirrel Monkeys usually live in groups of 40–50 but these groups may reach 200 or more. Breeding females tend to look after the offspring of another female. An infant may spend 30% of its time in the care of a mother other than its own. This monkey is **diurnal** (active during the day) and **arboreal** (lives in trees).

Threats

Bolivian Squirrel Monkeys are at most risk from the loss of their natural rainforest habitat in South America. Threats to this species include logging for the timber industry, land clearing for agriculture and the illegal pet trade.

At Perth Zoo

The Bolivian Squirrel Monkey exhibit is located in the **Lesser Primate** area.

Scientific Name
Saimiri boliviensis

Conservation Status

Extinct

Extinct in the Wild

Critically Endangered

Endangered

Vulnerable

Near-Threatened

Least Concern

Data Deficient

Body Length: 27–32 cm

Weight: 950 g

Gestation: 150–170 days

Number of young: 1

Distribution ■

Distribution: The Amazon, South America

Habitat: Rainforest

Did you know?

The Bolivian Squirrel Monkey is more vocal, social and active than the Common Squirrel Monkey. When they move through the forest, they twitter and cluck to bring insects and animals out for their food. They will spend half their day foraging for insects and around 10% of their day feeding on plants.
