

EMPEROR TAMARIN

Description

Emperor Tamarins have a speckled brown body and orange tail that is 39–42 cm long. Both females and males have a distinctive white, curly moustache. Tamarins have claw-like nails called **tegulae** which help them to climb.

Diet

Tamarins are **omnivores**. During the wet season they feed on fruit and during the dry season, feed on flowers, nectar and tree sap. They eat insects all year round.

In the wild

Emperor Tamarins are completely arboreal (live in the trees) and form mixed troops, often travelling with other related tamarin species. They almost always have two offspring and the father carries them when they are not feeding from the mother.

Threats

Tamarins are threatened by habitat destruction caused by logging.

At Perth Zoo

Perth Zoo's Emperor Tamarins can be seen in the **Lesser Primate** area.

Scientific Name
Saguinus imperator

Conservation Status

Extinct

Extinct in the Wild

Critically Endangered

Endangered

Vulnerable

Near-Threatened

Least Concern

Data Deficient

Body Length: 23–26 cm

Weight: 220–900 g

Gestation: 140–145 days

Number of young: 2

Distribution ■

Distribution: The Amazon, South America

Habitat: Lowland forest

Did you know?

Emperor Tamarins were named after Kaiser Wilhelm II of Germany (1888-1918) who had a long, walrus moustache.
